

# PRODUCT OVERVIEW

BETTER SEEDING,  
SPREADING & CULTIVATING

## SINGLE DISC SPREADERS

We recommend the Mini Spreader and the Single Disc Spreader Classic for small to medium working widths. The Single Disc Spreader Special achieves the best lateral distribution grade valuation (CV 9,4 % at 27 m). The spreading of slug pellets up to 28 m is possible. This model can be equipped with a sensor for the slider motor.

## TWIN DISC SPREADER

The Twin Disc Spreader achieves the best valuation grade on the slug pellets market by far. It is the most precise machine for applications with slug pellets up to 31 m working width and achieves the best lateral distribution grade (CV 11,9 % at 31 m). Independent Test Institutes and field tests done by trade magazines confirm this fact.

## MULTI-METERING SYSTEM

The Multi-Metering System MD range combines the advantages of our Pneumatic Seeders and Single Disc Spreaders. The compactness and precise metering is at the forefront! Due to the modular design of the unit, the MD can be equipped as a Single Disc Spreader as well as with metering outlets including hoses and a fan.

## PNEUMATIC SEEDERS

The Pneumatic Seeder covers almost all applications in the modern farming. A seeding shaft ensures precise metering. There are several hopper sizes available. The seeding close to the ground via hoses and dispersion plates promises an exact placement of your catch crops, nurse crops, grass reseeding and much more. You choose one of our control boxes individually, suitable to your requirements and needs.

## PNEUMATIC SEEDERS WITH BIG HOPPER SIZES

These models of our Pneumatic Seeders are ideal for farmers with large cultivation surfaces due to the large hopper volumes. All components are perfectly adapted to intensive use.

## PNEUMATIC SEEDERS FERTILISER EDITION

In addition to all the advantages of the Pneumatic Seeders (see above), these models are corrosion-resistant and thereby also fertilizer resistant. There are several hopper sizes available. The fertilizer edition is applicable for the application of fertilizers, micro granules as well as crop protection granules.

## PNEUMATIC SEEDER TWIN

The "TWIN-PS" has a centrally divided hopper. Two various seeds, fertilisers or granules can be metered individually and independently of one another. By this means, you sort out the problems of different sizes of seeds, application rates and seeding depths.

## IMPLEMENT CARRIER

The Implement Carrier simplifies the combination of our Pneumatic Seeders with trailed cultivation implements. The seeder is installed on the Implement Carrier, only the hoses and dispersion plates are mounted on the cultivation implement. The result is an optimal weight swift: You shift the weight from the implement's frame to the rear axle of the tractor.

## GRASSLAND HARROW

The Grassland Harrow works intensively and reliably with a unique combination of 10 mm and 8 mm tines. The aggressiveness of the working process is individually adjustable. Despite the rather low power requirement of the tractor you still achieve a high area performance. Levelling, harrowing and reseeding - all in one pass.

## GRASSLAND COMBI

The Grassland Combi is most appropriate for reseeding in hilly terrain. Due to the great advantage that the machine can be driven both as a rear machine and separately (harrow in front, roller in the rear), it is individually adaptable to your business. The power requirement of the tractor is rather low.

## GRASSLAND PRO HARROW

The Grassland Pro Harrow meets today's requirements of intensive maintenance of meadows in professional farming and contracting. Due to the unique combination of strong 12 mm tines and 8 mm tines, the grass sward is tilled to the optimum. The trailing roller assures the reconsolidation and soil contact with the seeds.

## GRASSLAND ROLLER

In order to ensure the contact between the seeds and the soil and to improve the germination of the seeds, the Grassland Rollers are extremely versatile. Rollers are available as Cambridge or toothed ring variation. Our seeders (Multi-Metering System and Pneumatic Seeder) can be mounted optimally for reseeding and new grass seeding.

## TINED WEEDER

The main focus of the Tined Weeder AS is on combating unwanted weeds. While the tines sweep over the soil, the weeds, which are already in threads or germ stage, are mostly buried, pulled out and deposited on the soil surface. This means that approximately 90 % of the weed germs are decimated.

## TINED WEEDER PRO

The Tined Weeder Pro VS adjusts with its unique tine spring system to the soil and protects the culture plant at the highest level. The tine pressure remains constant at different tine levels. As a result, crops planted on ridges, such as the potato, can also be harrowed. The tine pressure is identical on the ridge crown, ridge flanks and in the furrow.

## ROTARY HOE

The Rotary Hoe is ideal for breaking the encrustation. The rotating hoe rings bury or uproot the weeds, promote the tillering and introduce oxygen into the soil. Due to the rotating rings, the tines remain free of plant and soil material. The chopping rings are variably adjustable from 0 to 30 degrees and thus guarantee an ideal work result.

## SNOW AND ICE REMOVAL SPREADERS

The Universal Dispensers have a metering unit made of stainless steel and are suitable for the application of salt and grit and mixtures thereof. The exact metering by means of a seeding shaft makes them a reliable working tool for use in professional winter service.

We also offer Snow and Ice Removal Spreaders for private and small-scale application, which are like to be built on quads.

## LIQUID FERTILIZER

The Liquid Fertilizer enables a liquid fertilisation during the seeding process. Effective microorganisms, ensiling agents, plant stabilization and soil improvement also offer a multitude of possible uses. The use of sensors guarantees an exact, pinpoint application. You may choose out of a large selection of hose outlets and nozzles according to your individual needs.

## KIT FOR SOIL TESTING SOIL CHECK FULL EDITION

With the Soil Check Full Edition, you can quickly and easily check your soil for key figures: pH value, nitrate content, carbonate content, aggregate and humus stability, soil infiltration, soil temperature, general compaction, soil ranges and soil type as well as the soil type differences. You can identify the quality and the needs of your soil and, if necessary, adjust your management practices.
